

Turn your focus into a thriving forest of productivity with TreeFocus, the ultimate gamified focus app designed to help you achieve your goals while cultivating a virtual forest of beautiful trees. Say goodbye to distractions and hello to your new garden!

Whenever you need to focus and/or focusing on a time constraint, plant a tree! Set your desired work duration, and watch as a virtual tree starts to grow on your screen. As you concentrate, your tree flourishes, reflecting the time you've spent on focused work. When your timer completes, receive a gentle reminder to take a well-deserved break. Use this time to recharge and prepare for your next focused session. Each completed work session yields a unique "Tree." Collect these trees in your Tree Bank and watch your forest grow over time. Unlock and choose from a variety of tree types based on the number of trees in your bank. Whether it's a vibrant cherry blossom or a majestic oak, your forest will reflect your progress and dedication.

My MVP will allow for a tree to appear in a web browser and grow in several phases, most likely 32 part segments.

I will create this project within Spring, Java, SQL, and React
