ScentShelf

ScentShelf is a website that allows a user to display their collection of fragrances online like a "virtual shelf". ScentShelf will display data on a specific fragrance like notes, accord, performance, sillage, and user reviews. There will be a database that stores fragrances from 2013-2016, as well as the ability to add fragrance details mentioned earlier. There will be a login feature that lets users store these fragrances to show off on a "virtual shelf". The virtual shelf may or may not be customizable, but the user will be able to add, remove, and reorganize their virtual shelf. The user can also edit the details of a fragrance by adding and removing details. The user will be able to send a link of their collection to other people and when another user clicks that link, they can view it online.

 Your fragrances deserve the spotlight, and ScentShelf provides a dedicated showcase for each one. Your fragrance collection is a story worth sharing. Your collection, your rules, ScentShelf will elevate your collection.

The project will utilize different Amazon APIs to retrieve user reviews on different products. ScentShelf will also allow the user to mark fragrances they are looking for or looking to sell. The project will utilize Java, SpringBoot, MySQL, Angular, and hosting will be decided in the future.
